- ❖ We have determined our main objective as to cooperate with individuals, institutions and organizations with which we interact directly or indirectly with the awareness of the environmental and energy management in the works carried out during the ship design, new construction, maintenance, repair and design activities that serve the purpose of our shipyard's existence and to handle our energy and environmental inputs and outputs with the life cycle approach in order to fulfill their responsibilities towards their local and regional neighbors that will be affected by our activities.

We undertake;

- ❖ To provide the necessary sources to monitor and continuously improve the energy and environmental performance, which we have determined within the framework of this objective.
- ❖ To make workload and power plannings considering the environmental effects, energy use and consumption in our projects and design stages related to products and processes and to find optimum solutions to prevent pollution and reduce energy consumption.
- ❖ To monitor and measure the useful lives of our electricity, fuel and water consumption sources originating from our processes by constantly monitoring and measuring our important environmental aspects and important energy consumption points,
- ❖ To reduce and improve our greenhouse gas effects with the measures to reduce our solid, liquid and gaseous wastes generated during our activities in order to protect biodiversity, ecosystem and atmosphere,
- ❖ To show a proactive approach with effective measures to minimize environmental and energy consumption-related damages in case of any accident and emergency that may occur during our activities,
- ❖ To plan awareness-raising and awareness-expanding trainings for all shipyard and subcontractor employees in order to protect the environment and increase energy efficiency and to make this a public awareness,
- ❖ To ensure the supply of efficient products and services, to monitor, measure and audit to meet legal and other requirements while working in cooperation with subcontractors and suppliers,
- ❖ To continuously follow up the necessary resources and information in order to "continuously improve our Environmental and Energy performance".
